

ORIGAMI FIELD INSTALLATION GUIDELINES

Please read carefully before beginning installation.

Installing glass tile involves some basic procedures that differ from installing ceramic or stone tile. Following these procedures will ensure a successful installation. This guide covers installation of **Origami Field** glass tile. Origami Field glass tile is intended for INTERIOR use only, and is NOT suitable for use in exterior or submerged applications. For the Origami Mosaic (Mesh-Mounted) Glass Series, please refer to our separate **Origami Mosaic Installation Guidelines** available on our website.

The owner or owner's representative is responsible for determining the acceptability of the product. Prior to installation OPEN AND INSPECT ALL BOXES to verify tile series, size/pattern, color and finish. Notify your tile dealer immediately of any damage, defect or other issue. Variation in surface, color, shade, shape and size are inherent in artistic hand-crafted tile. Lunada Bay Tile recommends a random sampling be taken from multiple boxes, inspected and blended prior to and throughout the installation process. Installation constitutes acceptance.

PREPARATION

Glass tile must be installed over a properly prepared fully cured substrate—a clean, sound, flat surface that is free of cracks, contaminants, sealers, paint or adhesives. This is one of the most important factors in ensuring a good installation, as glass tile has translucent and reflective properties that may reveal the presence of inconsistencies in the substrate.

Approved Surfaces for Setting

Concrete slabs (on grade) cured a minimum of 28 days, free of cracks, curing agents and any signs of laitance.

Well cured mortar beds (ANSI A108.1B Standards-cured a minimum 7 days).

Cement Board/backer units (CBU) to ANSI A118.9 Standards (Note: An ANSI A108A-2.1.8 membrane is required behind all CBU installations in wet areas).

Gypsum board (dry areas only) installed to ASTM C1396 or ASTM C1396M-04 Standards.

Do not install glass tile directly over particle board, plywood or painted surfaces.

Step-By-Step Back Butter Method

Recommended method for installation of Origami Field Glass.

Important: It's critical to the success of the installation to first clean and wipe the back of all tiles prior to installation. We recommend using a 90% or above Isopropyl Alcohol applied to a clean micro fiber cloth. Please ensure that all dirt, dust and debris is removed prior to installation.

Wipe and thoroughly clean back of each tile prior to application of setting material. Please see important note above.

Apply thin-set to 100% coverage of back of tile.

Press tile into properly placed setting material.

Cutting Guidelines

- We recommend **WET** cutting and/or score and snap method **ONLY**
- Do **NOT** dry cut using power tools
- Improper cutting techniques could expose installer to harmful silica dust

Cutting Glass Tile	Drilling Holes
<ul style="list-style-type: none"> • Use ONLY a WET saw with a diamond blade for glass: <i>Montolit CPV Series; Alpha Vetro Series; MK Series</i> • Do NOT dry cut using power tools • To prevent rough edges, glass tiles must be cut slowly 	<ul style="list-style-type: none"> • WET drill tile <i>before</i> installation. Drilling from both sides will minimize chipping and cracking • Use a diamond core bit at low speed (250 to 300rpm) • Constantly wet the tile and drill bit with water during drilling to prevent tile from cracking • Openings should be 1/8" larger than fixture fittings to avoid stress transfer to the tile

Movement/Expansion Joints: Refer to TCNA -EJ171

A soft joint is required between any change in direction or 90-degree angle and any dissimilar material within the tile installation (tile to tile, tile to metal, tile to wood).

Additional movement provisions may be required based on the conditions of the project.

Step-By-Step Grouting

Our large format glass may contain noticeable surfaces variations as a result of the manufacturing process. During the grouting process, these may become more noticeable if grout residue is left to cure on the surface. A soft bristle brush may be used to remove the excess grout from the surface during the initial cleaning phase. It is critical to remove all excess grout from the surface of the tile before the grout is allowed to fully cure.

1 Pre-wash tile with damp sponge to remove 100% of glue or other residue before grouting.

2 Apply grout with a rubber float making sure joints are free of voids.

3 Use a damp sponge to remove excess grout, leaving only a slight haze residue. Use a soft bristled brush to aid if necessary

4 Wait 30-40 minutes before polishing off haze residue with a clean microfiber cloth. Perform as work progresses while grout is fresh.

5 Wait 12 hours before performing a 'final polish' to remove any residual haze with a dry terry or microfiber cloth.

Our large format Origami Field glass may benefit from a post-cure 'polish'. To clean excess grout use grout haze remover or diluted Miracle Heavy Duty Acidic Cleaner per manufacturers recommendation. Never spray directly onto the tile and always start at the higher dilution. Use of a soft bristle brush or Doodle Bug will aid this process. Follow product manufacturer's installation instructions. Always test small area first.

SETTING MATERIALS

ARDEX

www.ardexamericas.com

- X 77™ MICROTEC® Fiber Reinforced Thin Set Mortar (Dry Areas Only)
- X 77™ MICROTEC® Fiber Reinforced Thin Set Mortar with E 90™ Mortar Admix (Wet/Dry Areas)
- S 48™ Rapid-Set Mortar (Wet/Dry Areas)

BOSTIK

- Super Flex™ Ultra-Premium Thin Set Mortar (Wet/Dry Areas)

Acceptable systems for glass tile installation are continuously revised, as new technologies become available. While we are providing this basic list, this list should not be considered exclusive or complete. There may be other manufacturers who produce suitable installation products, including products we may not be aware of. It is the installer's responsibility to be knowledgeable about the most current recommended systems.
